“Risk and Resilience in Maltreated Children”

This investigation represents a study within a study; one that will provide rich data for the Research Domain Criteria (RDoC) project; and one that will also provide invaluable data on risk and resilience in maltreated children. This application delineates plans to examine the RDoC domain Negative Valence Systems, or more specifically, acute threat - “fear;” and proposes to collect data on multiple units of analysis included in the RDoC matrix: genes, circuits, and self-reports of clinical symptoms.

“Determinants of Adolescent Exercise Behavior: Towards Evidence-Based Intervention”

This application proposes a combined survey, laboratory, and intervention study using the

unique data collection in the Netherlands Twin Register (NTR) with longitudinal assessment of exercise behavior and many of its potential (environmental) moderators at ages 7, 9, 12, 14, 16, and 18. It aims to determine the causes of individual differences in voluntary exercise behavior from childhood to young adulthood and use this information to develop a novel family-based E-intervention program to change exercise behavior in young adolescents.
